Hexa-X use cases

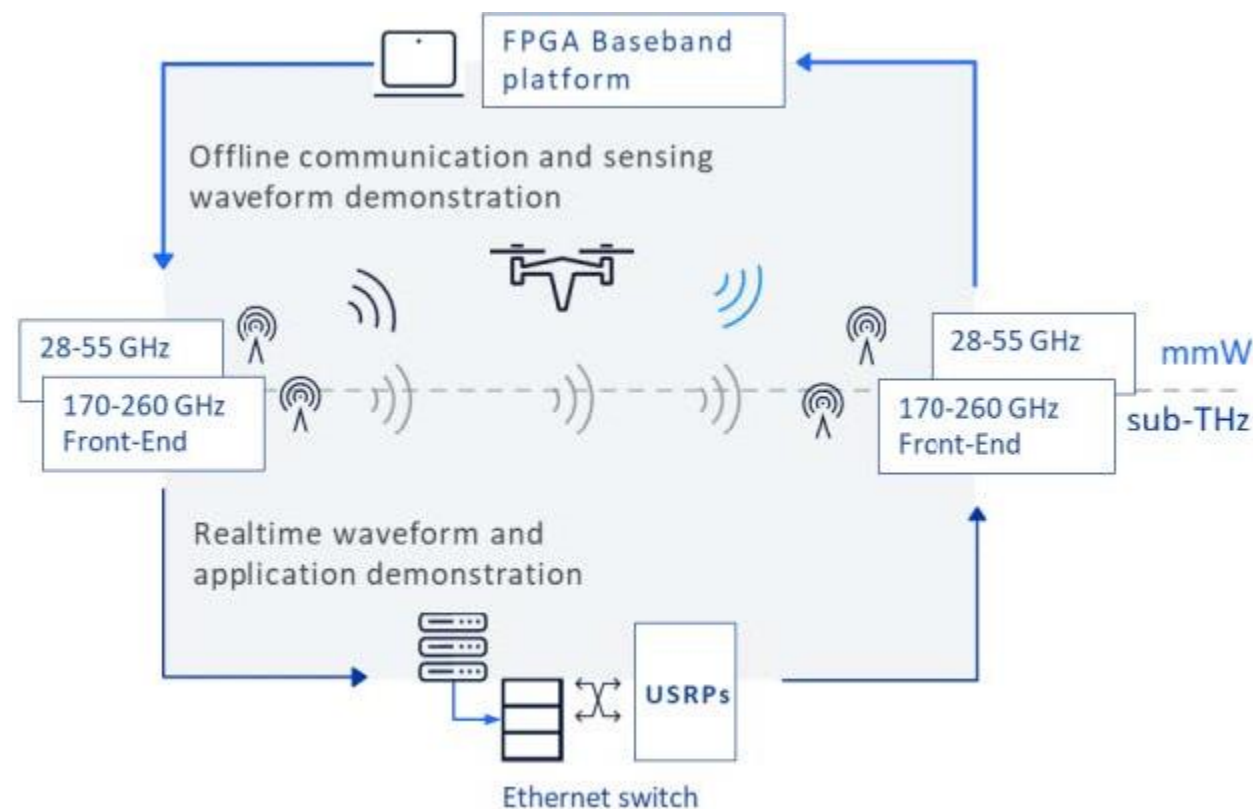

Timeline

Demo #1 6G OTA -Waveforms in Action

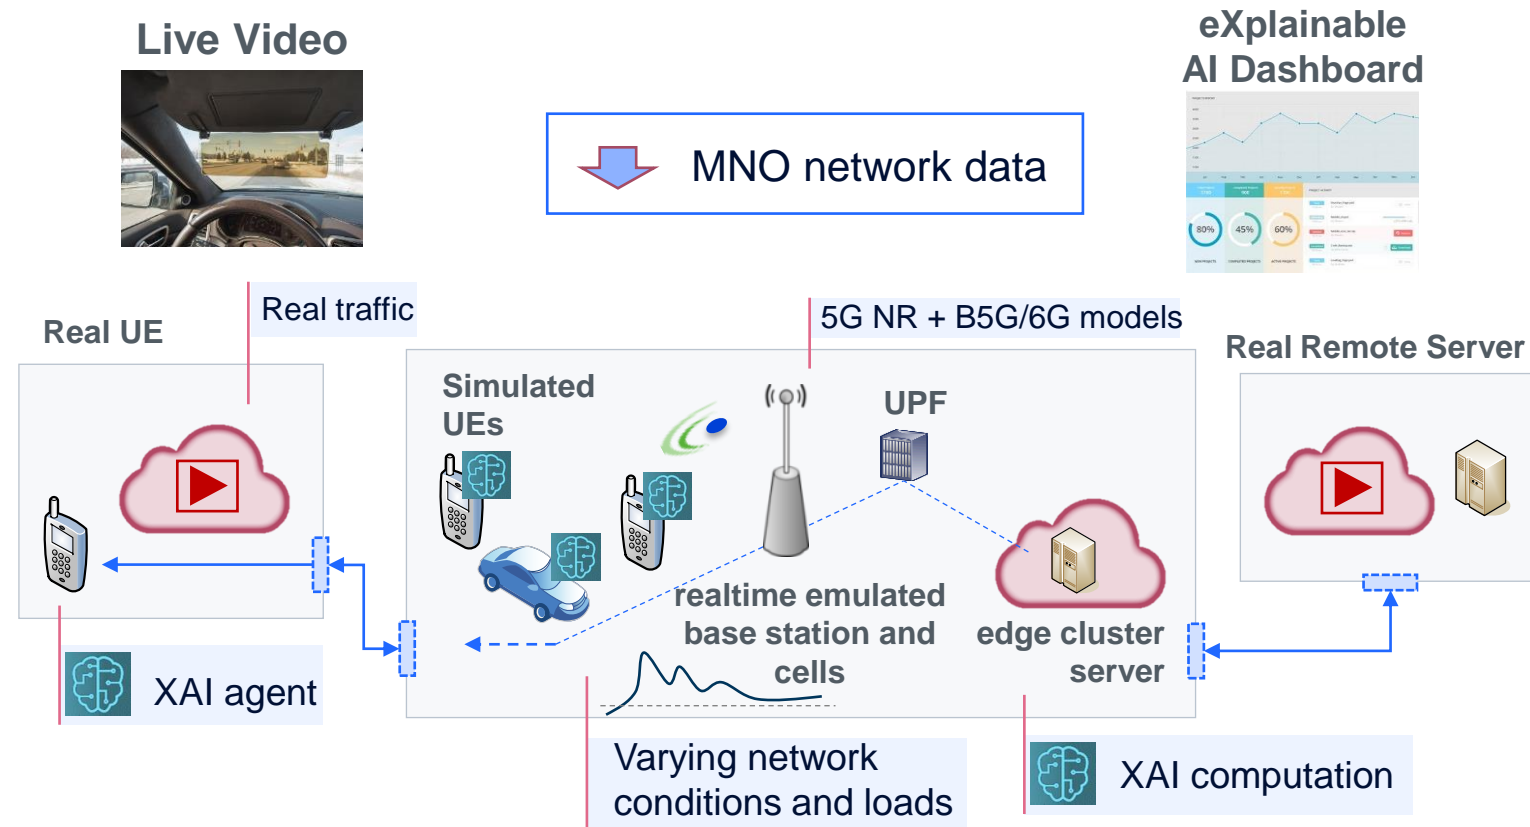

- Evaluate the performance of selected 6G candidate waveforms
 - Non-real time demonstration of radar sensing performance at mmW
 - Non-real time demonstration of communications and sensing performance at 200GHz region
 - Real-time demonstration of communications and sensing performance
- Participants:
 - Qamcom, University of Oulu and TU Dresden

Demo #2 FED-XAI - Federated XAI demo

- Demonstrate federated learning of XAI models, using a real-time network emulator and real terminals
 - End-user agents sense local data and collaboratively train an XAI model to make predictions (e.g., on QoS)
 - The federated model is transferred to other agents, which adapt it locally to perform predictions
 - An edge side-agent, federated with the end-user ones, displays in real time a dashboard, showing the predicted QoS
- Participants
 - University of Pisa, Intel and TIM

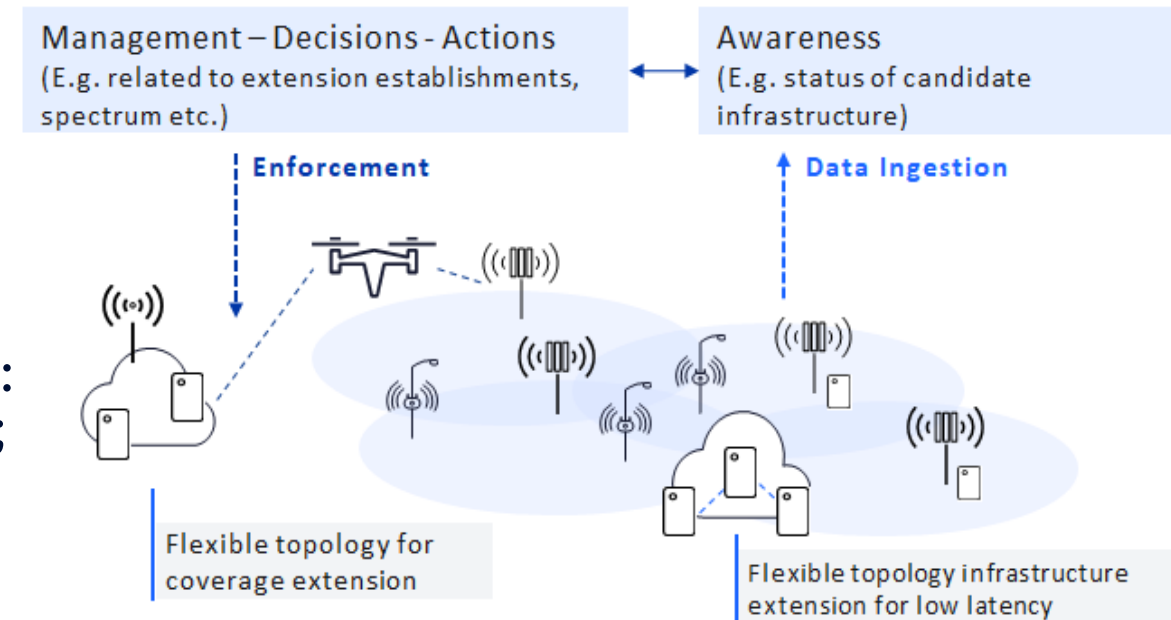

Demo #3 Flexible topologies (FLEX-TOP) for efficient network expansion and complementary means for global coverage, sustainability and trust

Increasing coverage, sustainability and trust

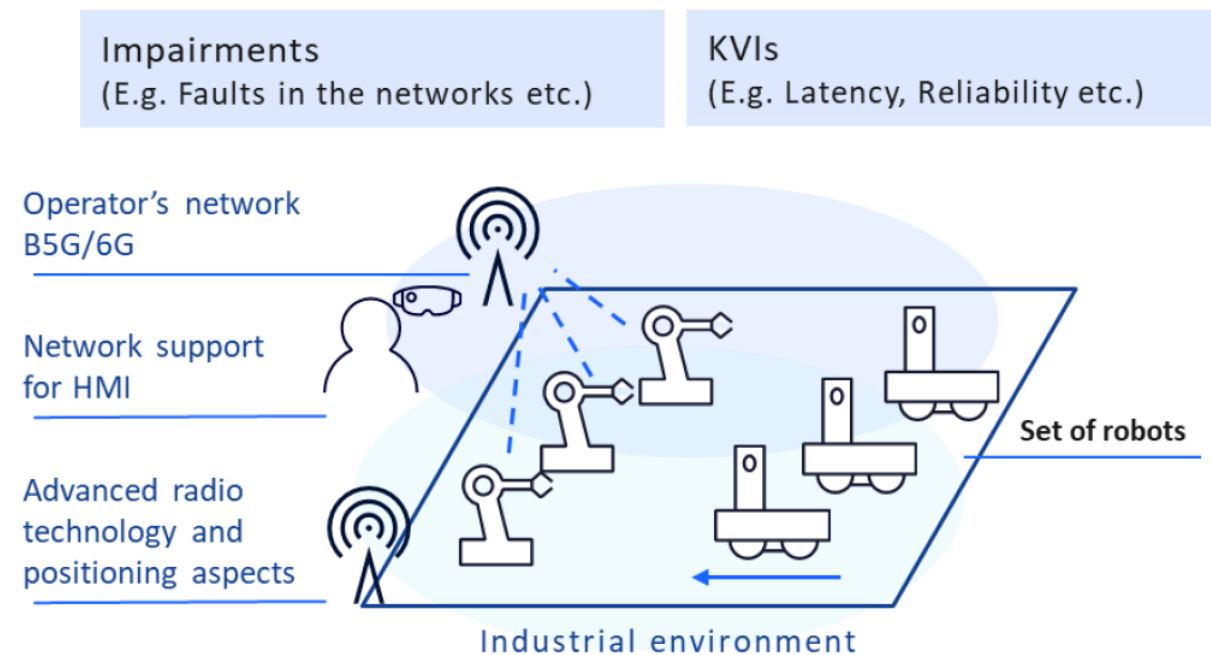

- Key benefits of a flexible topology will be
 - coverage extensions;
 - service provision with lower latencies;
 - security as the engagement is limited to selected devices;
 - lower energy consumption at the infrastructure.
- Management of the flexible topology will leverage on:
 - mesh/ad hoc/device-to-device (D2D) networking;
 - disaggregated devices;
 - usage of ultra-high spectrum also in coordination with the infrastructure.
- Demo can lead to cost-effective global service coverage for affordable digital inclusion and global monitoring of system critical environmental indicators.

Demo #4 Extreme performance in handling unexpected situations in industrial contexts

Increasing resilience through 6G enablers

- Demonstrating flexible topologies (3GPP and non-3GPP RATs) and predictive orchestration
 - Identification of network fault and/or device impairments through diagnostics mechanisms
 - redistribute functionality and roles
 - robot to robot, robot to infrastructure, robot to human
- Delivering high rate, low latency, and dependable HMI, human-in-the-loop, usage of AR for remote monitor/ control of robots
- Utilizing radio and positioning/sensing enablers for intent and impairment detection and validation

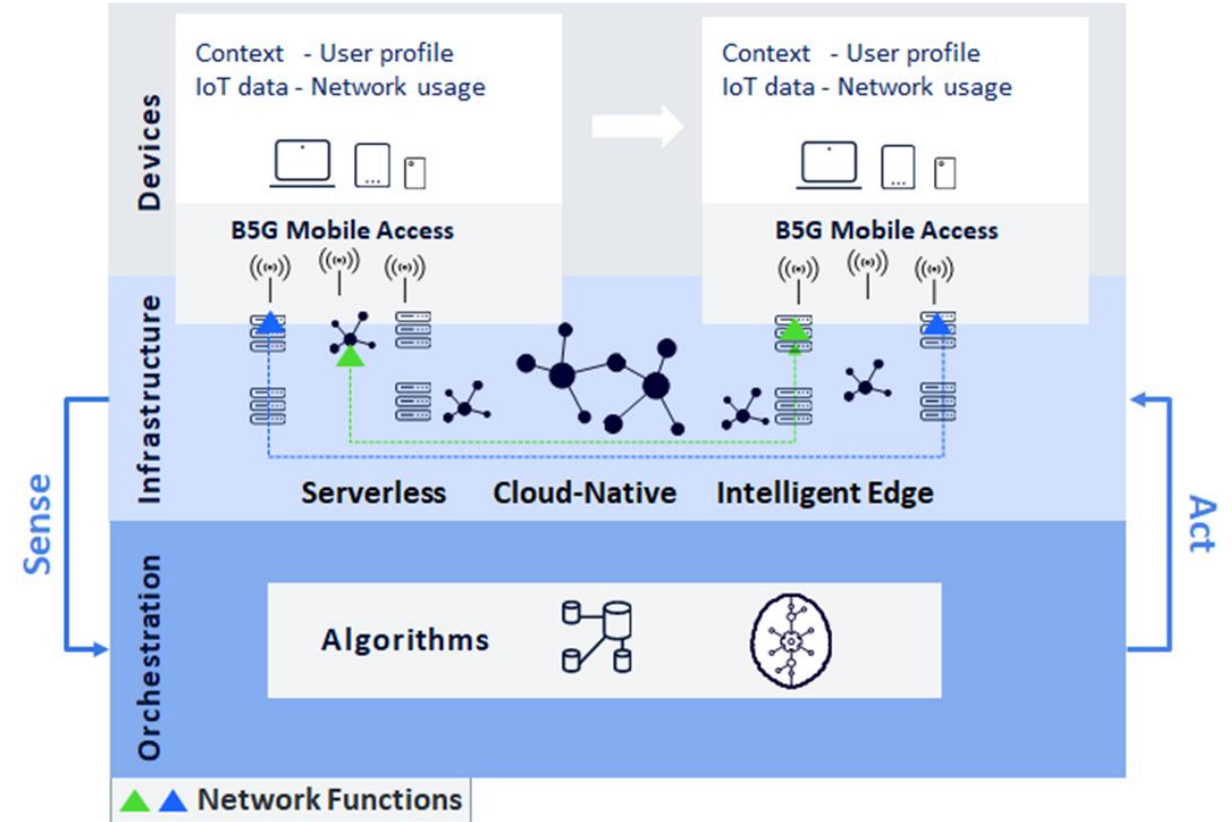

Participants: Wings, TU Kaiserslautern, Siemens

Demo #5 Data-driven device-edge-cloud continuum management

- To achieve zero perceived latency in 6G networks AI algorithms will predict future states in the end device (extreme edge).
- This demo will show the required actions that will be taken from the orchestration point of view to self-adapt the network to the predicted future state of the device using properly the resources.
- Participants:
 - Atos, Nextworks, Orange, Nokia and Universidad Carlos III Madrid

Thank you!
